

# ACM Advanced Central Monitoring TST7541

## ACM Software for addressable Central Battery Units

Advanced Central Monitoring (ACM) is a centralized remote monitoring system, which uses a separate network, for our addressable central battery systems. Thanks to the RS485 protocol, you can control the central battery system from up to one kilometer away with your computer.

ACM allows you to monitor up to 150 central battery systems at the same time. ACM enables luminaires and central battery systems to be placed on a buildings layout drawings. The software also provides information about faulty luminaires, executed tests, faults, and so on. The test history from the system is automatically saved to a log file.

ACM needs Java supported software and a PC with an internet connection. In fault situations, ACM sends a notification automatically to email addresses specified by the user. You can connect ACM to a building automation system using the optional BACnet module.

One BACnet interface can be used for CBU's up to 30nos. However more BACnet interfaces (one for each 30 CBU's) can be connected further to reach 150CBU's in total. A total of 5nos BACnet interfaces can be connected to one ACM software.
